

Managing Policy-Managed Oracle RAC Databases - Part I

By Ahmed Baraka

Objectives

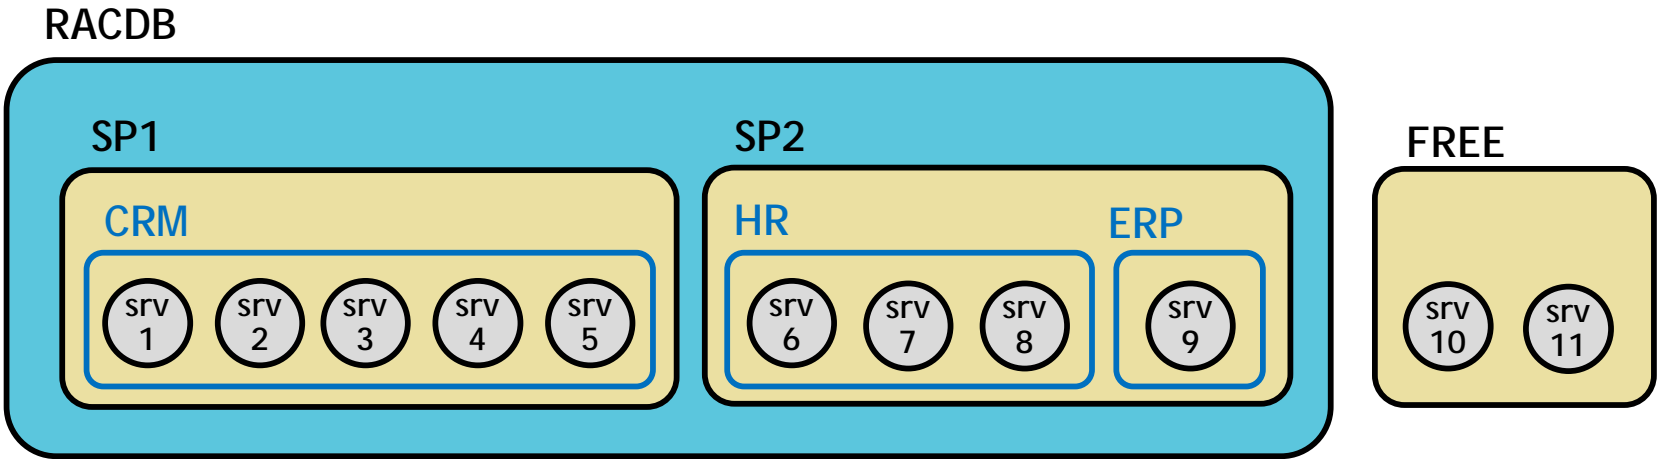

In this lecture, you will learn how to perform the following:

- Understand how the server pools are used in policy-managed RAC database
- Describe the benefits of Policy-managed RAC databases
- Create server pools for RAC databases
- Convert an Administrator-managed RAC Database to Policy-managed Database
- Create a Service for a Policy-Managed Database or PDB

Oracle RAC Database Deployment Types

- Administrator-managed
 - The only available Oracle RAC type before 11.2
 - Each instance is statically configured to a specific node in the cluster
 - Database services run on specific instances using the preferred and available designation
 - Challenges: in case of failover, it does not utilize free server.
- Policy-managed
 - Is based on server pool
 - Databases are deployed in one or more server pools

Policy-managed Oracle RAC
Layout Example

About Server Pools

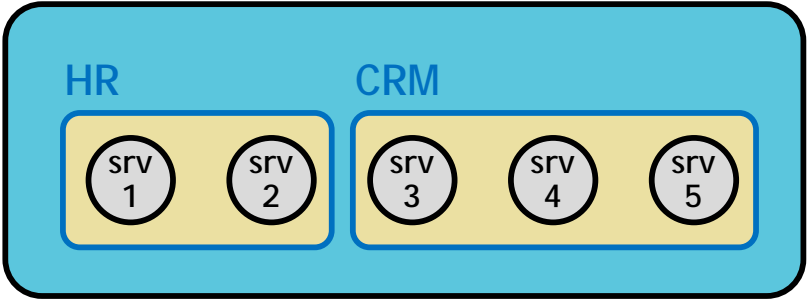

- Server pool is a logical group of cluster servers (nodes)
- Servers that are not assigned to any server pool belong to FREE
- Policy-managed RAC databases are configured based on server pools, not servers
- A server can belong to only one server pool at a time
- Clusterware can dynamically add or remove a server in or out of a server pool
- Services run as a **singleton** service or as a **uniform** service
- There can be only one instance of a particular RAC database on a specific server at any point in time

Sever Pool Properties

- Server pool properties:
 - Server placement and failover properties:
 - **MIN_SIZE** : the minimum number of servers. Zero is accepted.
 - **MAX_SIZE** : the maximum number to be allocated. -1 value means unlimited
 - Availability properties:
 - **IMPORTANCE** : the importance of the server pool. It accepts the values between 0 and 1000, where zero is lower boundary and 1000 is the upper boundary.

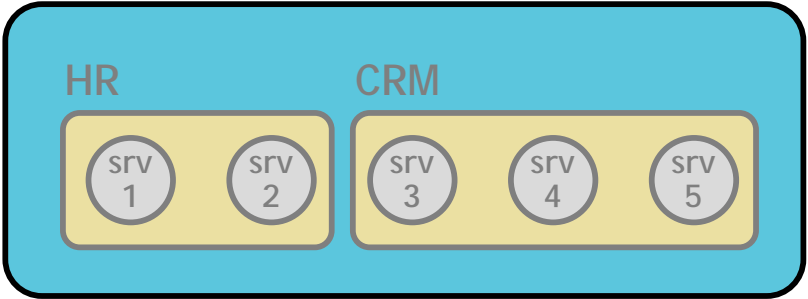

Administrator-managed RAC:
Database Service Start Order

Policy-Management Benefits

- Ensuring database service start order

Administrator-managed RAC:
Service Failover

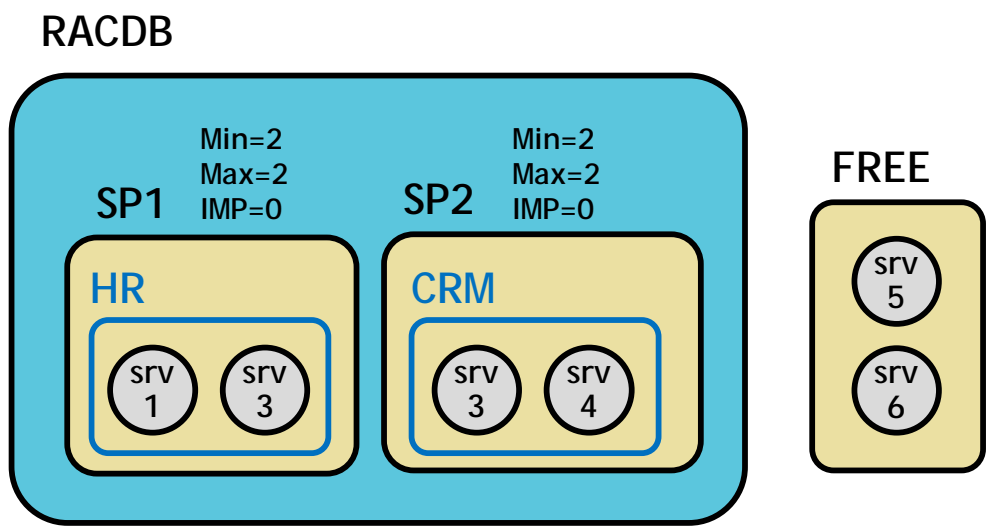

Administrator-managed RAC:
Service Failover

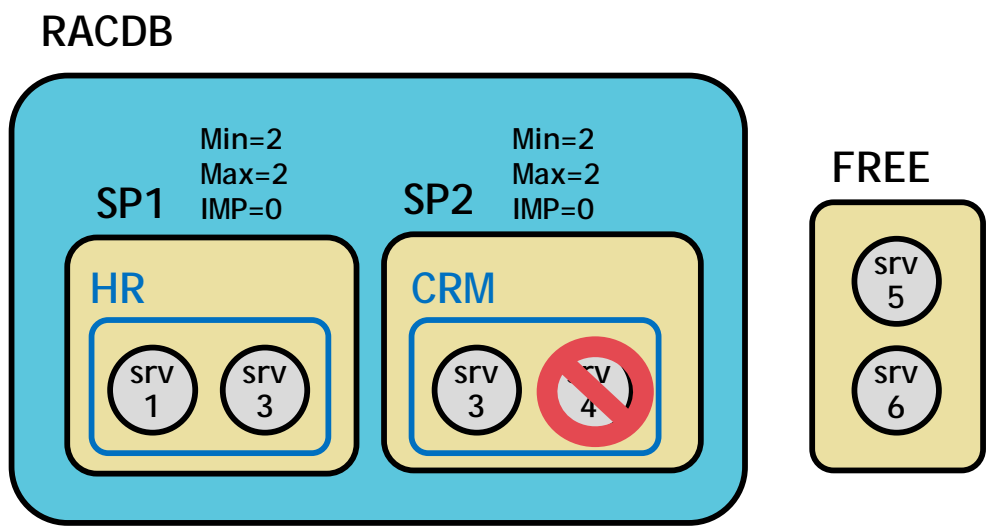

Administrator-managed RAC:
Service Failover

Policy-managed RAC:
Service Failover

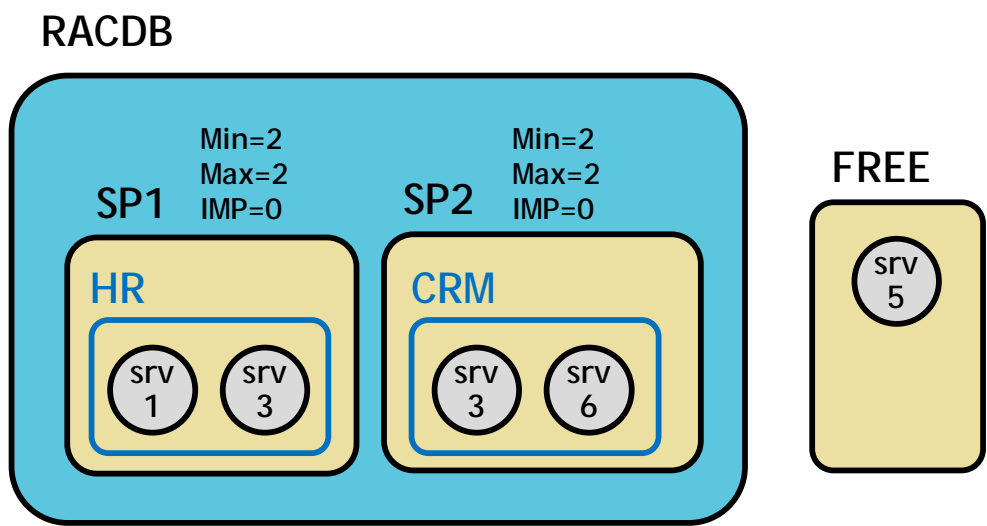

Policy-managed RAC:
Service Failover

Policy-managed RAC:
Service Failover

Policy-managed RAC:
Service Failover

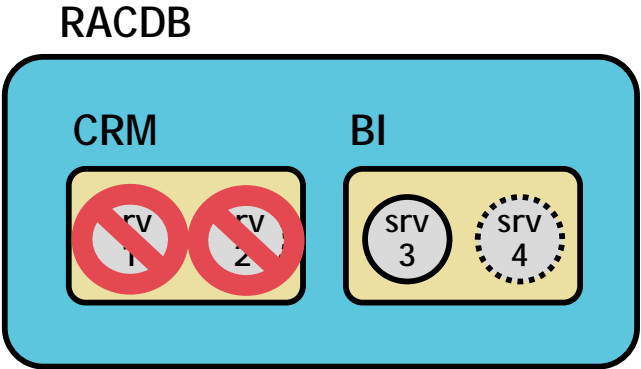

Policy-Management Benefits

- Ensuring database service start order
- Better service failover:
 - Automatically use any server in the FREE server pool for failover

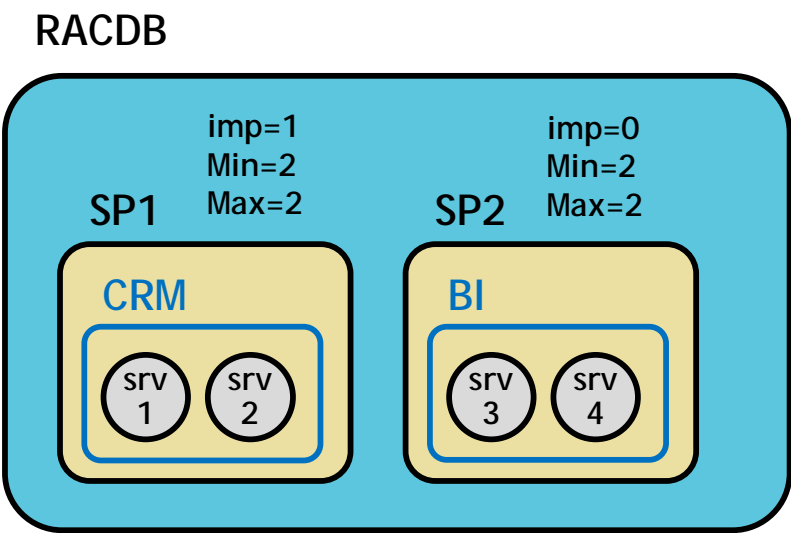

Administrator-managed RAC:
Multi-node outage on a critical service

Administrator-managed RAC:
Multi-node outage on a critical service

Policy-managed RAC:
Node failover and placement

Policy-managed RAC:
Node failover and placement

Policy-managed RAC:
Node failover and placement

Policy-Management Benefits

- Ensuring database service start order
- Better service failover:
 - Automatically uses any server in the FREE server pool for failover
 - Provides priority to important services for failover

About Default Server Pools

- Free Server Pool
 - Contains servers that are not assigned to any other server pools
 - Only IMPORTANCE and ACL can be edited by the user
- Generic Server Pool
 - Stores administrator-managed database servers

Creating a Server Pool

- By the clusterware owner:

```
srvctl add srvpool -serverpool srvpl_pbd -min 0 -max 4  
crsctl add serverpool sp1 --attr "MIN_SIZE=1, MAX_SIZE=1, IMPORTANCE=1"
```

- To list the available server pools and their status:

```
crsctl status serverpool [-p | -v | -f]
```

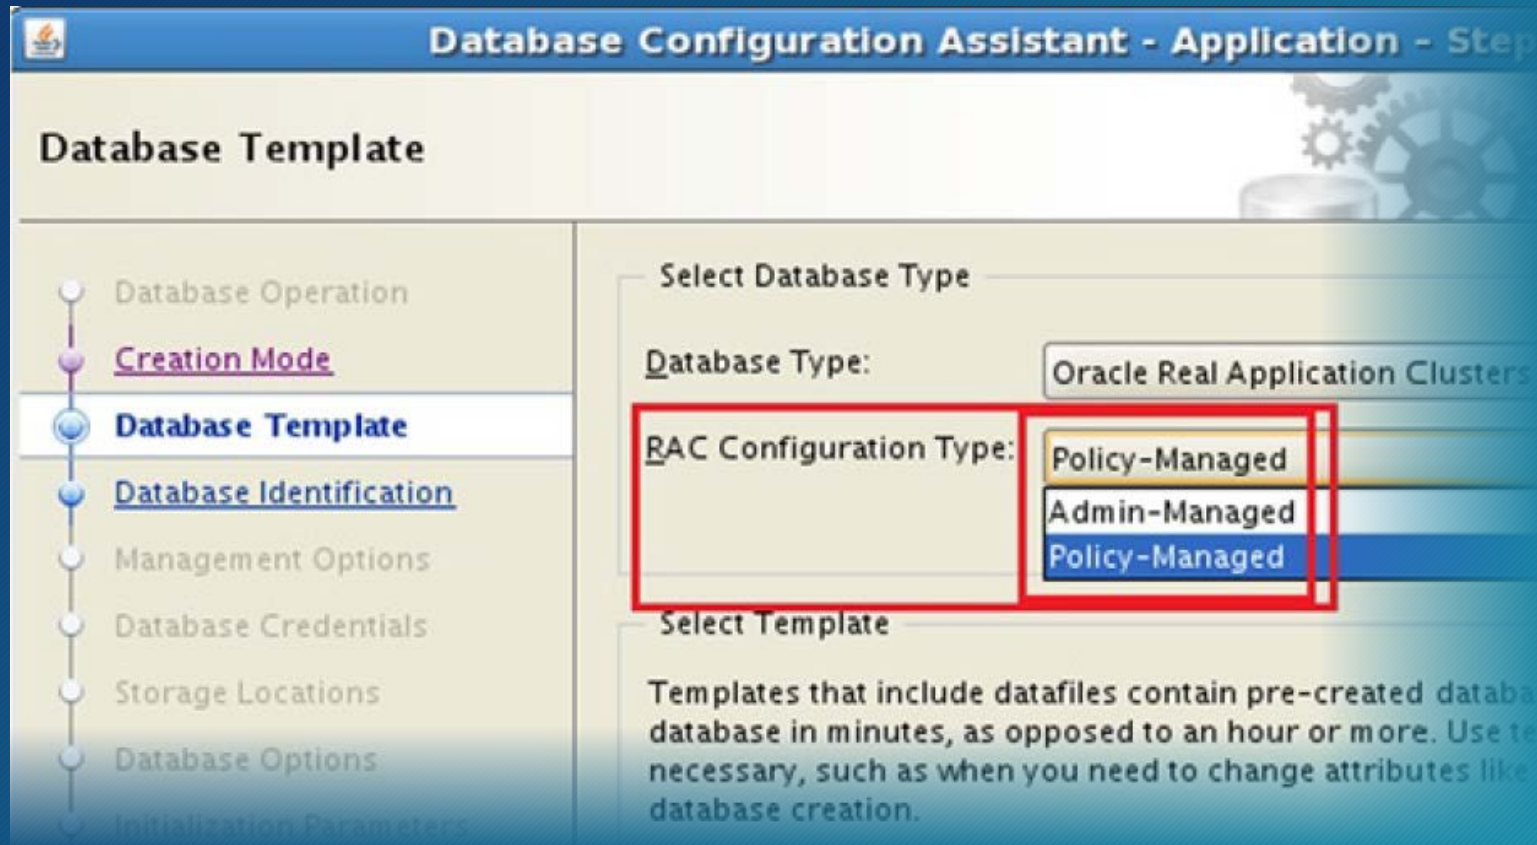

- To display configuration data of a specific server pool:

```
srvctl config serverpool -g Free
```

- To list available servers:

```
crsctl status server [-g | -p | -v | -f]
```

Creating a Policy-managed Database

Creating a Policy-managed Database (cont)

Database Operation

Creation Mode

Deployment Type

Server Pool

Database Identification

Storage Option

Fast Recovery Option

Database Options

Configuration Options

Management Options

User Credentials

Creation Option

Server pool is a group of servers that collectively work together to host database workload. Select the Server pool from the existing list or specify the detail of a new Server pool to be used by database.

☒ Create new Server pool for this database

Server pool name: Cardinality:

Parallel Query Server pool name: Cardinality:

☐ Use existing Server pool for this database

	Server pool name	Cardinality	Category
<input type="checkbox"/>	spool1	1	HUB
<input type="checkbox"/>	spool2	1	HUB

Converting an Administrator-managed RAC Database to Policy-managed Database

- To display the current deployment type:

```
srvctl config database -d rac
```

- To convert database to policy-managed database:

```
srvctl stop database -d rac  
srvctl modify database -d rac -g sp1  
srvctl modify database -d rac -serverpool sp1
```

- Instance new name format SID_*n*

Creating a Service for a Policy-Managed Database or PDB

- Cardinality option accepts: **SINGLETON** or **UNIFORM**
- A singleton service for a PDB:

```
srvctl add service -db rac -pdb pdb1 -service hrsrv -  
serverpool spool1 -cardinality singleton
```

- A uniform service for a RAC database:

```
srvctl add service -db rac -service hrsrv -serverpool  
spool1 -cardinality uniform
```

Summary

In this lecture, you should have learnt how to perform the following:

- Understand how the server pools are used in policy-managed RAC database
- Describe the benefits of Policy-managed RAC databases
- Create server pools for RAC databases
- Convert an Administrator-managed RAC Database to Policy-managed Database
- Create a Service for a Policy-Managed Database or PDB
